# Binary relation

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

Let  $A, B$  be two sets. A **binary relation** between the elements of  $A$  and  $B$  is any subset of the Cartesian product of  $A$  and  $B$ , i.e.  $R \subseteq A \times B$ .

We denote relations by capital letters, e.g.  $R, S$ , etc.

We say that two elements  $a \in A$  and  $b \in B$  are in relation  $R$  iff the pair  $(a, b) \in R$  (it can be also denoted as:  $aRb$ ).

# Examples

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

- **empty relation** (no pair belongs to it)
- **diagonal relation**  $\Delta = \{(x, x) : x \in X\}$  (it is the “equality” relation)
- **full relation**: any pair belongs to it (i.e.  $R = X^2$ )

# Binary relation as a predicate and as a graph

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

Binary relation can be represented as a predicate with 2 free variables as follows:

Given a predicate  $R(x, y)$ , for  $x \in X$  and  $y \in Y$ , the relation is the set of all pairs  $(x, y) \in X \times Y$  that satisfy the predicate (i.e. make it true)

Each binary relation can be naturally represented as a graph.

# Example

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

$R(x, y)$ : “x is less than y”

The relation  $R$  represented by the above predicate is the set of all pairs  $(x, y) \in X \times Y$  so that  $R(x, y)$  is true (i.e.  $x < y$ )

# Examples of binary relations

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

$$A = B = \mathcal{N}$$

- diagonal relation  $\Delta (x = y)$
- $x > y$
- $x \leq y$
- $x$  is a divisor of  $y$
- $x$  and  $y$  have common divisor
- $x^2 + y^2 \geq 10$

# More examples

Examples of relations on the set  $P \times P$ , where  $P$  is the set of all people.

- $(x, y) \in R \Leftrightarrow x$  is a son of  $y$
- $(x, y) \in R \Leftrightarrow x$  is the mother of  $y$
- $(x, y) \in R \Leftrightarrow x$  is the father of  $y$
- $(x, y) \in R \Leftrightarrow x$  is a grandmother of  $y$

# More examples

Examples of  $R \subseteq P \times C$ , where  $C$  is the set of all courses in the university for last 5 years.

- $(p, c) \in R \Leftrightarrow p$  passed course  $c$
- $(p, c) \in R \Leftrightarrow p$  attended course  $c$
- $(p, c) \in R \Leftrightarrow p$  thinks course  $c$  is interesting

# Domain and co-domain of relation

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

For binary relation  $R \subseteq A \times B$ , the set  $A$  is called its **domain** and  $B$  is called its **co-domain**

Domain and co-domain can be the same set.

# Image and pre-image of relation

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

**Pre-image** of binary relation  $R \subseteq X \times Y$ :

$$\{x \in X : \exists y \in Y (x, y) \in R\}$$

**Image** of binary relation  $R \subseteq X \times Y$ :

$$\{y \in Y : \exists x \in X (x, y) \in R\}$$

# Example

# Inverse of relation

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

If  $R \subseteq X \times Y$  is a binary relation then its **inverse**  
 $R^{-1} \subseteq Y \times X$  is defined as  $R^{-1} = \{(y, x) : (x, y) \in R\}$

Examples: what is the inverse of:  
“ $x < y$ ”?

# Inverse of relation

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

If  $R \subseteq X \times Y$  is a binary relation then its **inverse**  
 $R^{-1} \subseteq Y \times X$  is defined as  $R^{-1} = \{(y, x) : (x, y) \in R\}$

Examples: what is the inverse of:

“ $x < y$ ”?

“ $x$  is a parent of  $y$ ”?

# Composition of relations

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

If  $S \subseteq A \times B$  and  $R \subseteq B \times C$  are two binary relations on sets  $A, B$  and  $B, C$ , respectively, then the **composition** of these relations, denoted as  $R \circ S$  is the binary relation defined as follows:

$$R \circ S = \{(a, c) \in A \times C : \exists b \in B [(a, b) \in R \wedge (b, c) \in S]\}$$

Sometimes it is denoted as  $RS$ . If  $R = S$  then the composition of  $R$  with itself:  $R \circ R$  can be denoted as  $R^2$ .

More than 2 relations can be composed. We denote the  $n$ -th composition of  $R$  with itself as  $R^n$  (e.g.  $R^3 = R \circ R \circ R$ , etc.)

Composition is associative, i.e.:

$$(R \circ S) \circ T = R \circ (S \circ T)$$

# Example

## Discrete Mathematics

# Examples: transitive closure of relation

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

For a binary relation  $R \subseteq X^2$  its **transitive closure** is defined as the smallest relation  $T$  so that  $T$  is transitive and  $R \subseteq T$

Example: transitive closure of:

“x is a son of y”?

“x == y”?

# Examples: transitive closure of relation

Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

For a binary relation  $R \subseteq X^2$  its **transitive closure** is defined as the smallest relation  $T$  so that  $T$  is transitive and  $R \subseteq T$

Example: transitive closure of:

“x is a son of y”?

“x == y”?

“x  $\geq$  y”?

# Equivalence relation

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

A binary relation  $R \subseteq X^2$  is **equivalence relation** iff it is:

- reflexive
- symmetric
- transitive

# Equivalence class

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

An **equivalence class** of the element  $x \in X$  of the equivalence relation  $R \subseteq X^2$  is defined as:

$$[x]_R = \{y \in X : xRy\}$$

(notice that, due to symmetry of equivalence relation,  $xRy$  is equivalent to  $yRx$ )

For  $[x]_R$ ,  $x$  is called the **representative** of this equivalence class.

There can be many representatives of the same equivalence class.

# Partition of a set

A family  $F$  of non-empty subsets of some set  $X$  is called **partition** of  $X$  if the following two conditions hold:

- for any two different  $A, B \in F$  it holds that  $A \cap B = \emptyset$
- $X$  is the union of all sets from  $F$  ( $X = \bigcup F$ )

Each set from  $F$  is called a **partition block**.

Examples?

# Partition of a set

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

A family  $F$  of non-empty subsets of some set  $X$  is called **partition** of  $X$  if the following two conditions hold:

- for any two different  $A, B \in F$  it holds that  $A \cap B = \emptyset$
- $X$  is the union of all sets from  $F$  ( $X = \bigcup F$ )

Each set from  $F$  is called a **partition block**.

Examples?

odd an even numbers form two blocks of partition of integers

# Properties of equivalence classes

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

If  $[x]_R$  and  $[y]_R$  are two equivalence classes of some equivalence relation  $R$ , then either:

- $[x]_R \cap [y]_R = \emptyset$  (do not intersect)  
or:
- $[x]_R == [y]_R$  (are identical)

Since  $\forall x \in X [x]_R \neq \emptyset$  (due to reflexivity of  $R$ ), and different equivalence classes are disjoint the following holds:

The equivalence classes **partition** the domain of the equivalence relation.

# Example

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

What are the equivalence classes of the following equivalence relations?

- $x == y$
- “x has the same diploma supervisor as y”

# Quotient of the set by equivalence relation $R$ (operation of abstraction)

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

Given an equivalence relation  $R \subseteq X^2$  we call the family of all its equivalence classes the **quotient of  $X$  by  $R$** :

$$X/R = \{[x]_R : x \in X\}$$

(the similarity to division symbol for numbers is not coincidental, since it has some similar properties)

The  $X/R$  operation is also called the “abstraction operation”, i.e. we abstract from any properties that are indifferent for the equivalence relation  $R$ .

# Example

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

What is  $X/R$  if:

# Example

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

What is  $X/R$  if:

- $X$  is the set of natural numbers and  $R$  is equality ( $x = y$ )?

# Example

What is  $X/R$  if:

- $X$  is the set of natural numbers and  $R$  is equality ( $x = y$ )?
- $P$  is the set of students and  $R$  is the set of pairs of students that have the same diploma supervisor?

# Order

Consider a relation  $R \subseteq X^2$  is called a **partial order** and four properties:

- 1 reflexive
- 2 anti-symmetric
- 3 transitive
- 4  $\forall x, y \in X \ xRy \vee yRx$

Relation  $R$  is:

- partial order if it satisfies conditions 1-3 above
- quasi order if it satisfies only 1 and 2
- linear order if it satisfies all conditions 1-4 above

# Examples

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

Is the following relation a partial order, quasi order, linear order,  
?

- $\leq$  (on numbers) ?
- $\Delta$  (on any set)? (“x=y”)
- $<$  (on numbers)
- $\subseteq$  (on sets)?

# Generalisation: n-ary relation

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

An  $n$ -ary relation  $R$ , for  $n \in \mathcal{N}$  is defined as  $R \subseteq X_1 \times X_2 \dots X_n$ .  
Binary relation is a special case for  $n = 2$ .

In particular, for:

- $n = 1$ , 1-ary relation is the set of some elements of the domain that satisfy some property (e.g. even numbers, etc.)
- $n = 0$ , 0-ary relation, that is empty can be theoretically interpreted as a *constant* in the domain of the relation (e.g. “0” in natural numbers) that has some special properties

# Example tasks/questions/problems

Discrete  
Mathematics

(c) Marcin  
Sydow

Properties

Equivalence  
relation

Order  
relation

N-ary  
relations

For each of the following: precise definition and ability to compute on the given example (if applicable):

- Relation and basic concepts
- Properties of binary relations
- Composition and inverse
- Equivalence relation, equivalence classes
